ACKNOWLEDGEMENTS

Hecla Greens Creek Mining Company provided financial support and Greens Creek Mine environmental staff, Chris Wallace, Ted Morales, Mitch Brooks, and Gunnar Fredheim provided project logistical support and water quality data. U.S. Forest Service Fishery Technician Christina Mounce assisted with sampling.

Division of Habitat staff Kate Kanouse and Gordon Willson-Naranjo assisted with data collection, Greg Albrecht and Nicole Legere processed periphyton samples, and Kate Kanouse verified data entry and analyses. Operations Manager Dr. Al Ott, Southeast Regional Supervisor Jackie Timothy, and Kate Kanouse reviewed and edited the report, Nora Foster of NRF Taxonomic Services identified the benthic macroinvertebrates, and Division of Commercial Fisheries Publication Specialist Amy Carroll prepared the report for publication.

Thank you all for your contribution.

EXECUTIVE SUMMARY

Since 2001, the Alaska Department of Fish and Game (ADF&G) has completed the aquatic biomonitoring studies the U.S. Forest Service (USFS) and Alaska Department of Environmental Conservation (ADEC) require for Hecla Greens Creek Mining Company's Greens Creek Mine. This partnership provides ADF&G the opportunity to gather and review data, and help identify, assess, and resolve issues that could affect aquatic resources near the mine site.

The aquatic studies include sampling periphyton, benthic macroinvertebrates, and juvenile fish in Greens Creek and Tributary Creek, two streams near mine development and operations. In 2015, we completed these studies at Greens Creek sites 48 and 54, and Tributary Creek Site 9.

The National Weather Service reports 2015 was the second wettest year on record for Juneau, with July the wettest on record.^a

Among the 2015 samples from each site, mean periphyton densities^b, mean benthic macroinvertebrate densities, numbers of macroinvertebrate taxa, and proportions of sensitive aquatic insects were within the ranges of natural variation.

The 2015 juvenile Dolly Varden char *Salvelinus malma* populations at each site were within range of most population estimates from previous years. We captured 21 juvenile coho salmon *Oncorhynchus kitsutch* at Greens Creek Site 54, the greatest number since the fish pass was damaged in late 2005, and coho salmon continue to be the most abundant fish species at Tributary Creek Site 9. Whole body juvenile fish metals concentrations for the 2015 Greens Creek Site 48 and Site 54 samples were similar to or less than values observed in previous years, while several concentrations among the Tributary Creek Site 9 samples were the greatest observed.

^a The Juneau climate summary for the year of 2015. National Oceanic Atmospheric and Administration NWS Juneau, AK Climate Database. <http://www.arh.noaa.gov/wmofcst.php?wmo=CXAK57PAJK&type=public> (accessed February 12, 2016).

^b We usually find significant differences in chlorophyll *a* densities between the current year and the 2003 and 2006 data for Site 48 and Site 54. Periphyton densities at both sites in 2003 and 2006 were the greatest observed since 2001, which we attribute to natural variation.

INTRODUCTION

The Greens Creek Mine is located about 29 km southwest of Juneau by air, near Hawk Inlet on the west side of Admiralty Island, and within the Tongass National Forest and the Admiralty Island National Monument (USDA Forest Service 2013). The mine has operated since 1989, except between 1993 and 1996 when the mine was temporarily closed, and produces gold, lead, silver, and zinc concentrates for export. Hecla Greens Creek Mining Company (Hecla), a subsidiary of Hecla Mining Company, Coeur d'Alene, Idaho, has owned and operated the mine since April 2008.

Most mine infrastructure is located in two drainages that support both resident and anadromous fish: the dry-stack tailings disposal facility (TDF) at the headwaters of Tributary Creek, and the mill, mine facilities, and production rock storage areas adjacent to Greens Creek (Figure 1).

Figure 1.–Greens Creek Mine area map.

The mine's USFS approved Plan of Operations Fresh Water Monitoring Program (FWMP; HGCMC 2014, Appendix 1) and ADEC Waste Management Permit 2014DB0003 require aquatic studies in Greens Creek and Tributary Creek to document stream health near mine facilities.

The Division of Habitat began the aquatic studies for the Greens Creek Mine in 2001. Reports summarizing sampling results from previous years are available in Weber Scannell and Paustian (2002), Jacobs et al. (2003), Durst and Townsend (2004), Durst et al. (2005), Durst and Jacobs (2006–2010), Kanouse (2011–2012), Kanouse and Brewster (2013–2014), and Kanouse (2015).

PURPOSE

The purpose of this technical report is to summarize the 2015 sample results and document the condition of biological communities in Greens Creek and Tributary Creek near mine development and operations. This report satisfies the requirements for Hecla's USFS approved Plan of Operations (HGCMC 2014) and ADEC Waste Management Permit 2014DB0003.

AQUATIC STUDIES

We completed the following studies:

- periphyton density and community composition;
- benthic macroinvertebrate density and community composition;
- juvenile fish populations and fish condition; and
- whole body juvenile Dolly Varden char metals concentrations.

STUDY AREA

We completed the aquatic studies at the following sample sites (Figures 2, 3):

1. Greens Creek Site 48, reference site upstream of mine activities;
2. Greens Creek Site 54, downstream of mine activities; and
3. Tributary Creek Site 9, downstream of the TDF.

We have sampled Site 48, Site 54, and Site 9 annually since 2001. We sampled a fourth site, Greens Creek Site 6, in 2001, 2006, and 2011 (Kanouse 2012).

Figure 2.–Map of Greens Creek biomonitoring sample sites and mine facilities

Figure 3.—Map of Tributary Creek biomonitoring sample site and mine facilities.

Greens Creek

The Greens Creek watershed is about 58.5 km² (USGS 2016) and the main channel measures about 16 km long from the alpine headwaters to the mouth at tidewater. At each sample site, gradients range from 2% to 4%, cobble is the dominant substrate, and large woody debris is common. The creek is largely fed by snowmelt and other drainages, and the magnitude of peak discharge in early summer depends on snowpack depth. Rainfall events during the fall also cause peak discharges.

Greens Creek Site 48

Site 48 (Figure 4) is located upstream of all mine activities, except exploratory drilling, near 265 m elevation and about 0.8 km upstream of the mine portal. Reference data collected at Site 48 are compared to data collected downstream at Site 54. Resident Dolly Varden char is the only fish species we have documented at Site 48; the infiltration gallery concrete weir near the mine portal blocks upstream fish passage. Periphyton and benthic macroinvertebrate sampling occur in riffle habitats downstream of the fish sample reach.

Figure 4.—Greens Creek Site 48.

Greens Creek Site 54

Site 54 (Figure 5) is located downstream of the Bruin Creek confluence and adjacent to waste rock storage Site 23, near 225 m elevation and about 1.8 km downstream of the mine portal. Data collected at Site 54 are compared to data collected at reference Site 48 to detect potential changes from waste rock storage areas, stormwater ponds, and mine and mill facilities upstream. We have documented coho salmon, Dolly Varden char, and cutthroat trout *O. clarkii* at Site 54. Anadromous fish access the site via a fish pass about 5.6 km upriver from the mouth, though only limited fish passage has been available since 2005.^c Periphyton and benthic macroinvertebrate sampling occur in riffle habitats upstream of the fish sample reach. Gallagher Creek enters Greens Creek within the fish sample reach.

Figure 5.—Greens Creek Site 54.

^c In 1989, Greens Creek Mining Company installed an engineered fish pass as mitigation for impacts to Tributary Creek from the TDF. Three timber and concrete weirs provided step pools for adult coho salmon passage upstream through a natural bedrock chute that prevents fish migration. In November 2005, flood flows damaged the fish pass during a heavy rainstorm when discharge measured up to 272 ft³/s; mean daily discharge during November generally ranges 20–60 ft³/s, and annual peak snowmelt discharge is usually < 200 ft³/s (USGS 2007).

Tributary Creek

The Tributary Creek watershed is about 1.7 km² (USDA Forest Service 2013) and the main channel measures about 1.6 km between the headwaters and the stream confluence with Zinc Creek. The TDF occupies the original headwaters of the creek. Tributary Creek is a low-energy, lowland stream fed by groundwater, precipitation, and a few hillside drainages. Stream gradient varies from 1% to 2%, organics and sand are the dominant substrates with gravel present near the mouth, and large and small woody debris are common. Tributary Creek provides habitat for chum salmon *O. keta*, coho salmon, pink salmon *O. gorbuscha*, cutthroat trout, rainbow trout *O. mykiss*, Dolly Varden char, and sculpin *Cottus* sp. Discharge estimates based on field measurements and limited gage data suggest annual stream flows range 1–5 ft³/s (USDA Forest Service 2003).

Tributary Creek Site 9

Site 9 (Figure 6) is located 1.2 km downstream of the TDF at about 25 m elevation, and sampled to detect potential changes from the TDF. We have documented coho salmon, Dolly Varden char, cutthroat and rainbow trout, and sculpin at this site. Periphyton and benthic macroinvertebrate sampling occurs within the fish sample reach after the juvenile fish population study is complete.

Figure 6.—Tributary Creek Site 9.

METHODS

We used the methods described in Kanouse (2015), and footnote differences in the *Results* section. Sample data and data summaries are in Appendix A–F.

We occasionally review data sets to ensure accuracy and report corrections in the document and appendices. The most recent technical report presents the current data sets and should be used to analyze data from previous years.

RESULTS

Within three weeks prior to sampling Greens Creek in 2015, mean daily discharges were generally less than the means of the previous 25 years, except prior to and during sampling on July 15–16 (Figure 7). The range of mean daily discharges three weeks prior to sampling in 2015 was similar to the 2014 range and other years (Figure 8). The USDA Natural Resources Conservation Service (2015) Alaska snow pack map suggests the remaining snow pack near Greens Creek Mine on May 1, 2015 was less than 25% of the 30-year median (1981–2010); peak snowmelt discharge in Greens Creek occurred between May 14 and May 23 (USGS 2016).

Figure 7.—Greens Creek mean daily discharge (ft³/s) three weeks prior to sampling in 2015, and mean daily discharges for the period 1990–2014.
 Source: USGS Gage 15101490 (USGS 2016).

Figure 8.—Greens Creek mean daily discharges three weeks prior to sampling.
 Note: Median, minimum, and maximum mean daily discharges (ft³/s) presented.
 Source: USGS Gage 15101490 (USGS 2016).

GREENS CREEK SITE 48

We sampled Greens Creek Site 48 on July 16, 2015. Hecla personnel recorded the following water quality data at 0840: water temperature 8.9 °C, conductivity 99.2 μS/cm, and pH 8.07 units. Using our flow data^d, we estimate discharge at the sample site was about^e 80 ft³/s after sampling. The USGS gage, located downstream of Site 48 and Hecla’s water withdrawal, recorded 65 ft³/s at the same time and a mean daily discharge of 75 ft³/s.

Periphyton Density and Community Composition

The 2015 mean chlorophyll *a* density was 3.73 mg/m², within the range observed since 2001, and proportions of chlorophylls *a*, *b*, and *c* were similar to previous years (Figures 9, 10).

Figure 9.—Greens Creek Site 48 periphyton densities.

note: Mean density ± one standard deviation, excludes potential outliers (*).

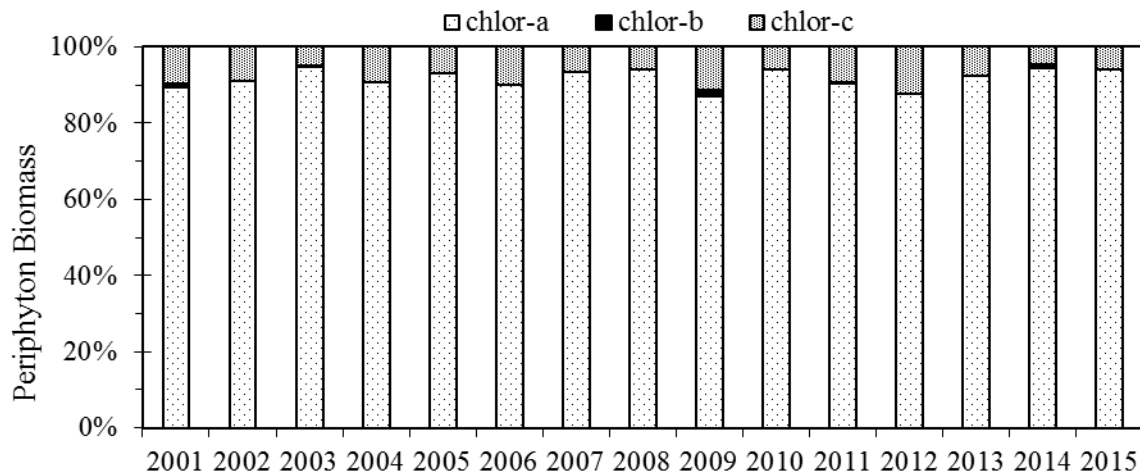

Figure 10.—Greens Creek Site 48 mean chlorophylls *a*, *b*, and *c* proportions.

^d In 2015, we used a SonTek FlowTracker to measure (SonTek 2007) stream discharge.

^e Discharge may be overestimated due to accidental deviation from established sampling methods; we oriented the flow probe perpendicularly to stream flow instead of perpendicularly to the stream channel.

Benthic Macroinvertebrate Density and Community Composition

We observed more insects and taxa among the 2015 samples^f compared to samples from the last four years. We counted 27 taxa and estimate benthic macroinvertebrate density at 2,948 insects/m², of which 82% were EPT insects (Figures 11, 12). Dominant taxa were Ephemeroptera: *Drunella* and *Baetis*, representing 26% and 17% of samples.

Figure 11.—Greens Creek Site 48 benthic macroinvertebrate densities and taxa.
 Note: Mean density ± one standard deviation, and taxa richness (×).

Figure 12.—Greens Creek Site 48 benthic macroinvertebrate community composition.

^f We collected three additional samples compared to previous years, per the requirements of the updated FWMP (HGCMC 2014, Appendix 1).

Juvenile Fish Populations and Fish Condition

We estimate the 2015 juvenile Dolly Varden char population at 120 ± 23 fish, within the range of previous estimates (Figure 13). The length frequency diagram of captured Dolly Varden char suggests multiple age classes were present, as in most^g years. Mean fish condition among the 97 Dolly Varden char we captured was 1.01 g/mm^3 (Appendix C4), similar to mean fish condition observed 2012–2014.

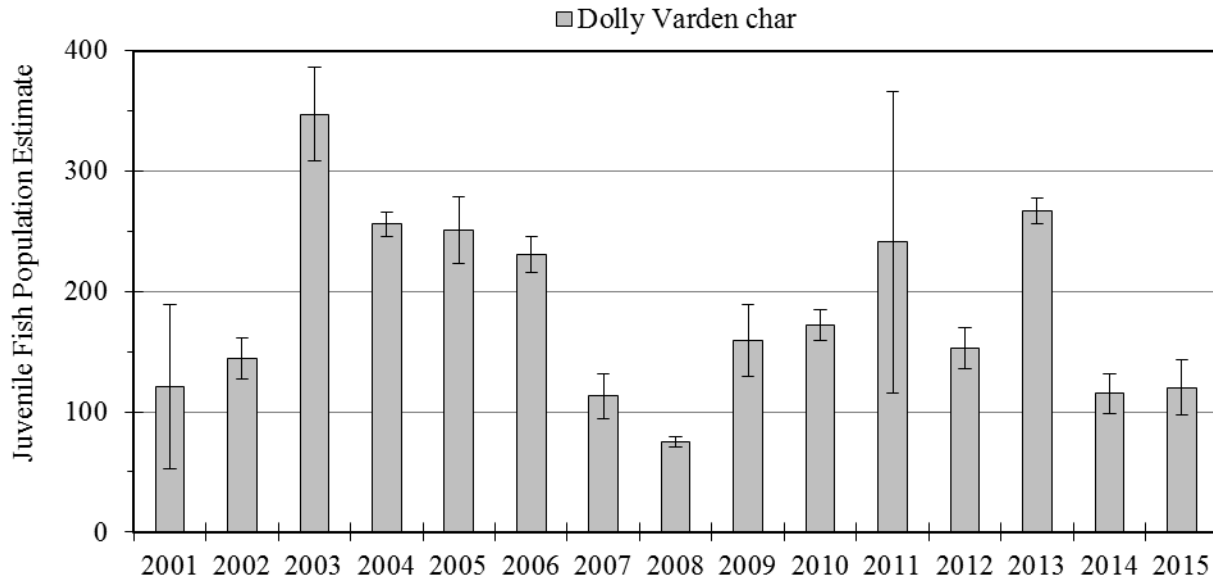

Figure 13.—Greens Creek Site 48 juvenile fish population estimates.

Juvenile Fish Metals Concentrations

Ag, Cd, Cu, Hg, Pb, Se, and Zn concentrations among the 2015 whole body juvenile Dolly Varden char samples^h were similar to values observed since 2001 (Figure 14).

^g In 2008 and 2012 we did not capture young-of-year fry, which could have escaped the 6.35 mm (1/4 in) mesh minnow traps.

^h We collected four additional samples compared to previous years, per the requirements of the updated FWMP (HGCMC 2014, Appendix 1).

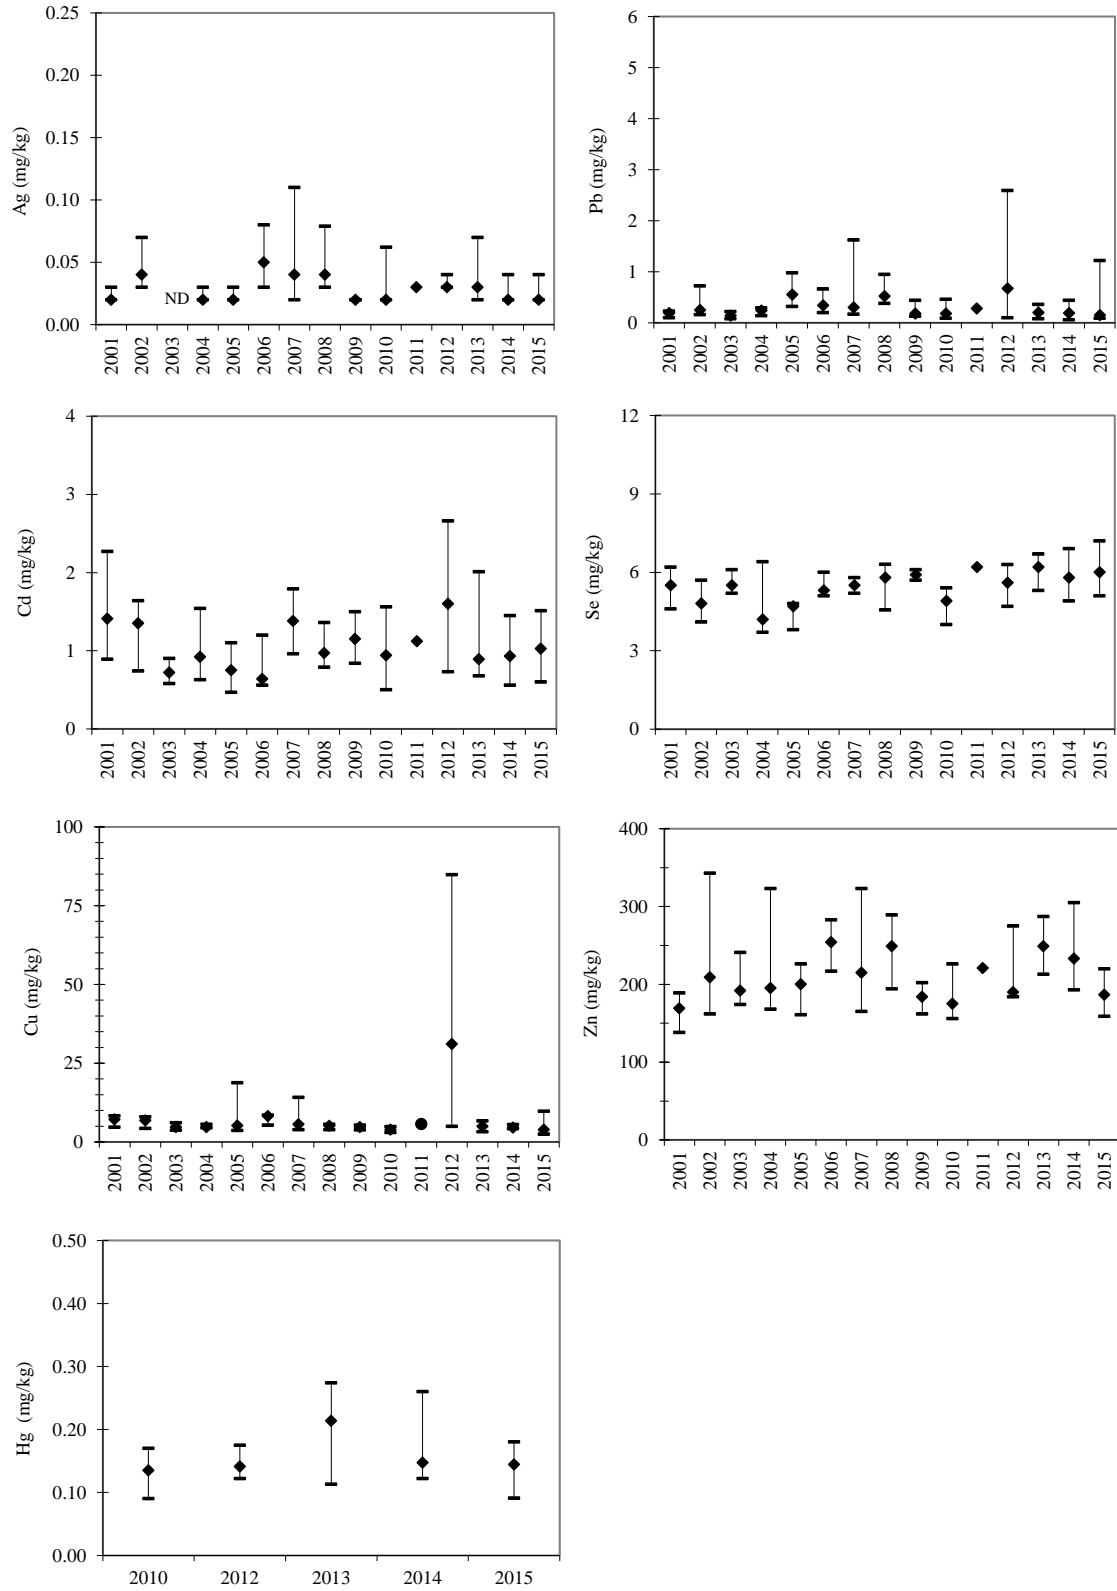

Figure 14.—Greens Creek Site 48 whole body Dolly Varden char metals concentrations.
Note: Median, minimum, and maximum concentrations (mg/kg) presented.

GREENS CREEK SITE 54

We sampled Greens Creek Site 54 on July 15, 2015. Hecla personnel recorded the following water quality data at 1200: water temperature 9.7 °C, conductivity 90.1 $\mu\text{S}/\text{cm}$, and pH 8.00 units. Using our flow dataⁱ, we estimate discharge at the sample site was about^j 106 ft^3/s after sampling. The USGS gage, located 0.8 km upstream, recorded 100.7 ft^3/s at 1400 and a mean daily discharge of 103 ft^3/s .

Periphyton Density and Community Composition

The 2015 mean chlorophyll *a* density was 2.45 mg/m^2 , within the range observed since 2001, and proportions of chlorophylls *a*, *b*, and *c* were similar to previous years (Figures 15, 16).

Figure 15.—Greens Creek Site 54 periphyton densities.
 Note: Mean density \pm one standard deviation, excludes potential outliers (*).

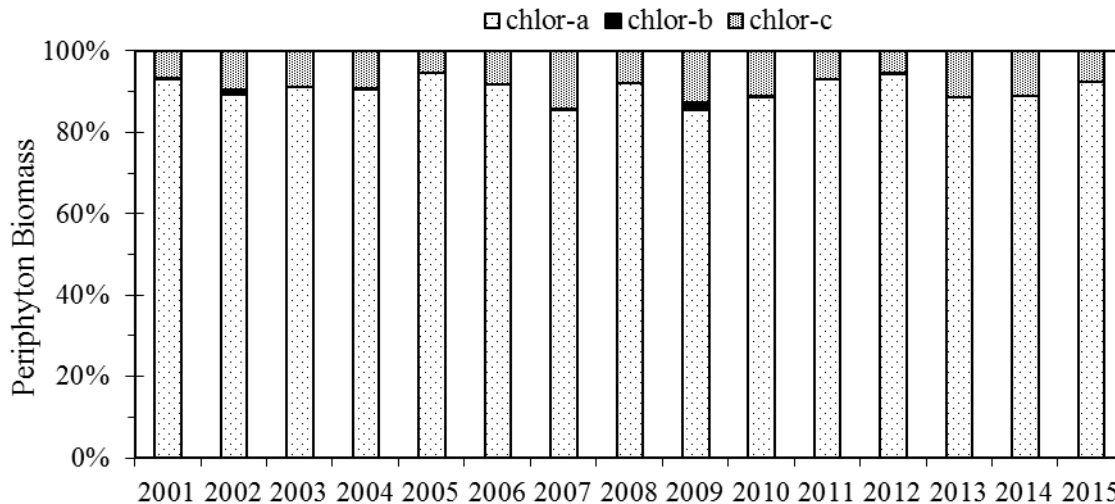

Figure 16.—Greens Creek Site 54 mean chlorophylls *a*, *b*, and *c* proportions.

ⁱ In 2015, we used a SonTek FlowTracker to measure (SonTek 2007) stream discharge.

^j Discharge may be overestimated as several measurements accounted for more than 10% of stream flow, which decreases accuracy of the discharge estimate.

Benthic Macroinvertebrate Density and Community Composition

We observed fewer insects among the 2015 samples^k than the 2014 samples, though within range observed most previous years. We counted 28 taxa and estimate benthic macroinvertebrate density at 1,887 insects/m², of which 82% were EPT insects (Figures 17, 18). Dominant taxa were Ephemeroptera: *Drunella* and *Epeorus*, representing 29% and 16% of samples.

Figure 17.—Greens Creek Site 54 benthic macroinvertebrate densities and taxa.
 Note: Mean density ± one standard deviation, and taxa richness (x).

^k We collected three additional samples compared to previous years, per the requirements of the updated FWMP (HGCMC 2014, Appendix 1).

Figure 18.—Greens Creek Site 54 benthic macroinvertebrate community composition.

Juvenile Fish Populations and Fish Condition

We estimate the 2015 juvenile Dolly Varden char population at 108 ± 7 fish, significantly less than the previous four estimates (Figure 19). The length frequency diagram of captured Dolly Varden char suggests multiple age classes were present, as in previous years. Mean fish condition among the 102 Dolly Varden char we captured was 1.00 g/mm^3 , similar to mean fish condition observed 2012–2014.

We captured 21 juvenile coho salmon¹ during the 2015 survey, the greatest number since 2005 (Figure 19). The length frequency diagram of captured fish suggests more than one age class was present (Appendix C6), and mean fish condition was 1.07 g/mm^3 .

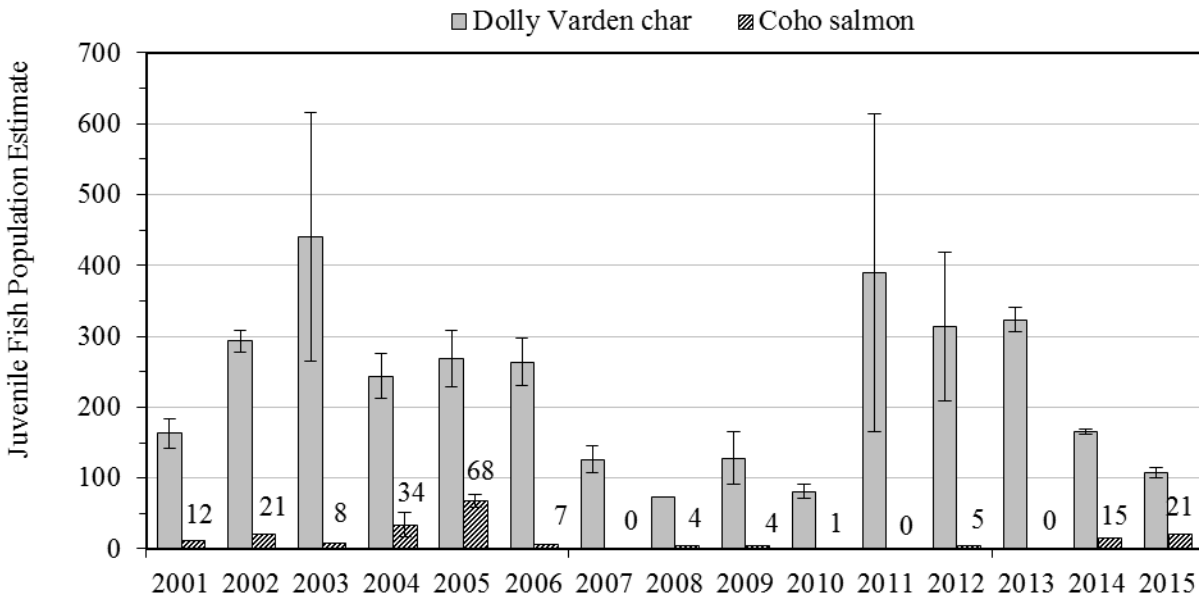

Figure 19.—Greens Creek Site 54 juvenile fish population estimates.
 Note: 2001–2010 data from 28 m sample reach, 2011–2015 data from 50 m sample reach.

Juvenile Fish Metals Concentrations

Ag, Cd, Cu, Hg, Pb, Se, and Zn concentrations among the 2015 whole body juvenile Dolly Varden char samples^m were similar to values observed since 2001 (Figure 20).

¹ We were unable to calculate the 2015 juvenile coho salmon population estimate due to the small sample size.
^m We collected four additional samples compared to previous years, per the requirements of the updated FWMP (HGCMC 2014, Appendix 1).

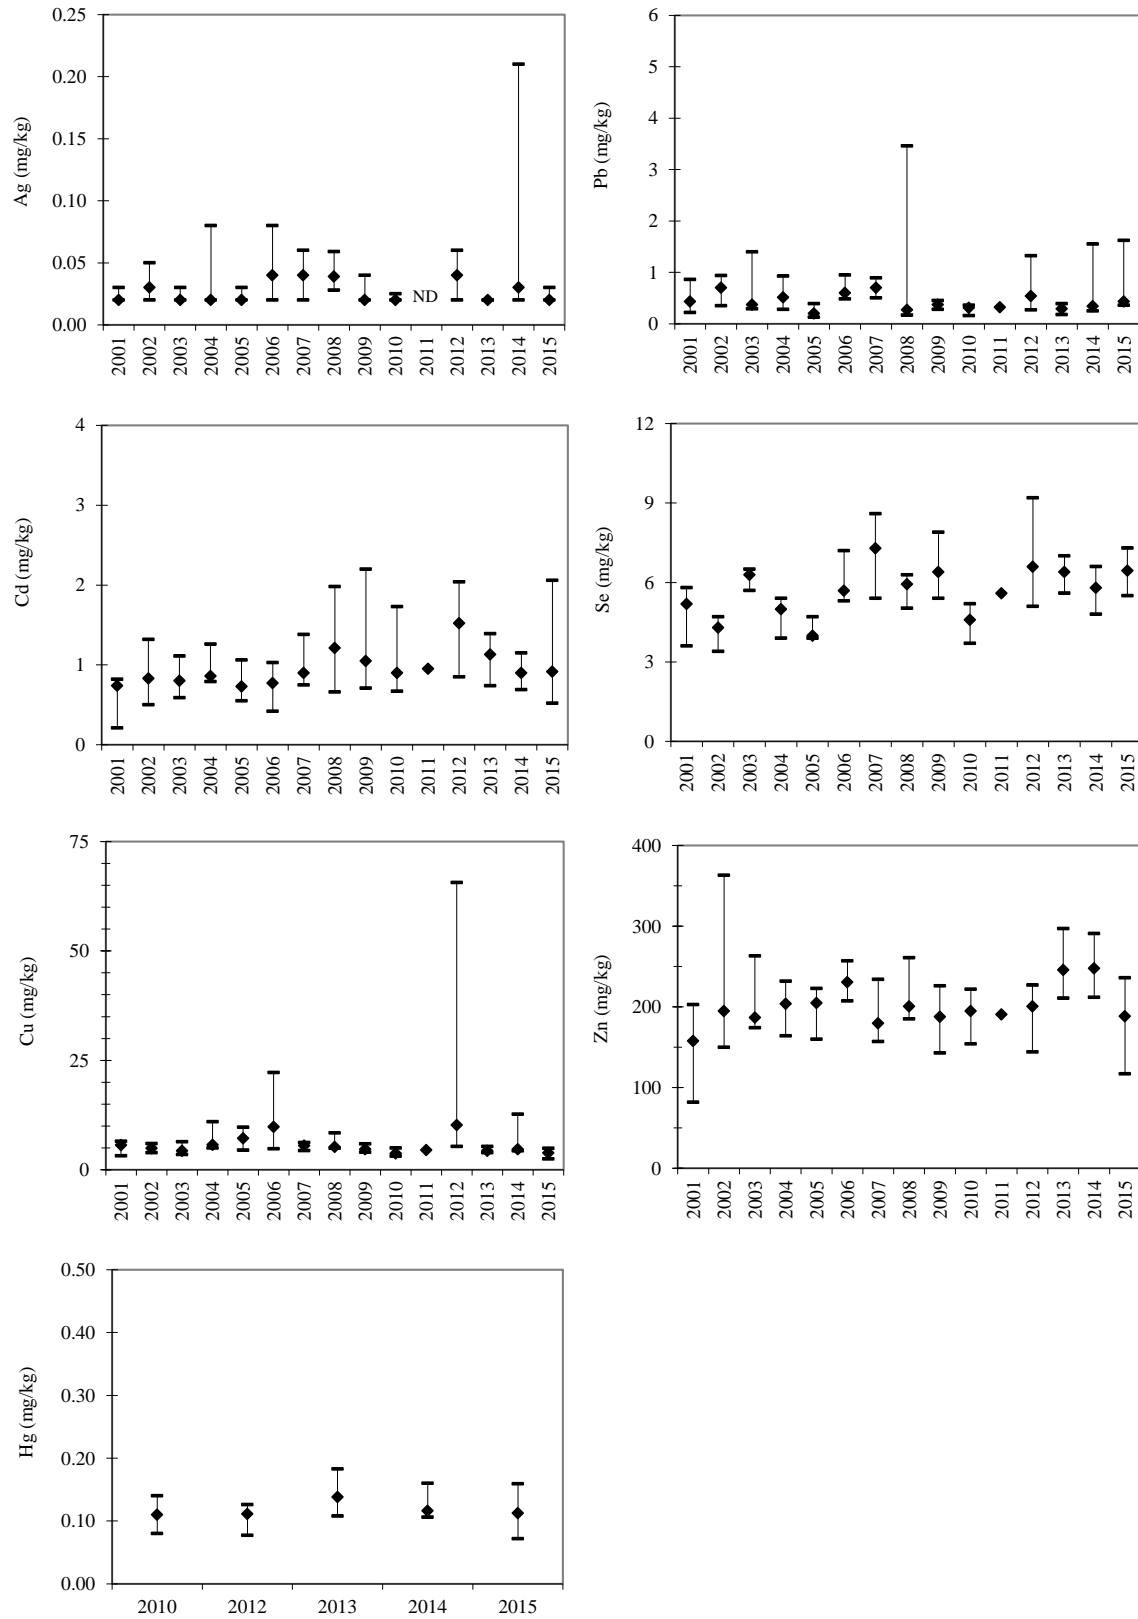

Figure 20.–Greens Creek Site 54 whole body Dolly Varden char metals concentrations.
Note: Median, minimum, and maximum concentrations (mg/kg) presented.

TRIBUTARY CREEK SITE 9

We sampled Tributary Creek Site 9 on July 14, 2015. Hecla personnel recorded the following water quality data at 1500: water temperature 12.8°C, conductivity 65.9 $\mu\text{S}/\text{cm}$, and pH 6.95 units. Using our flow data, we estimate discharge at the sample site was about 1.8 ft^3/s after sampling.

Periphyton Density and Community Composition

The 2015 mean chlorophyll *a* density was 5.75 mg/m^2 , within the range observed since 2001 (Figure 21), and proportions of chlorophylls *a*, *b*, and *c* were similar to previous years (Figure 22).

Figure 21.—Tributary Creek Site 9 mean periphyton densities.

Note: Mean density \pm one standard deviation, excludes potential outliers (*).

Figure 22.—Tributary Creek Site 9 mean chlorophylls *a*, *b*, and *c* proportions.

Benthic Macroinvertebrate Density and Community Composition

We observedⁿ the lowest number of insects at this site since 2010. We counted 23 taxa and estimate benthic macroinvertebrate density at 749 insects/m², of which 58% were EPT insects (Figures 23, 24). Dominant taxa were Chloroperlidae insects and Oligochaeta, representing 19% and 17% of samples.

Figure 23.–Tributary Creek Site 9 benthic macroinvertebrate densities and taxa.
 Note: Mean density ± one standard deviation, and taxa richness (×).

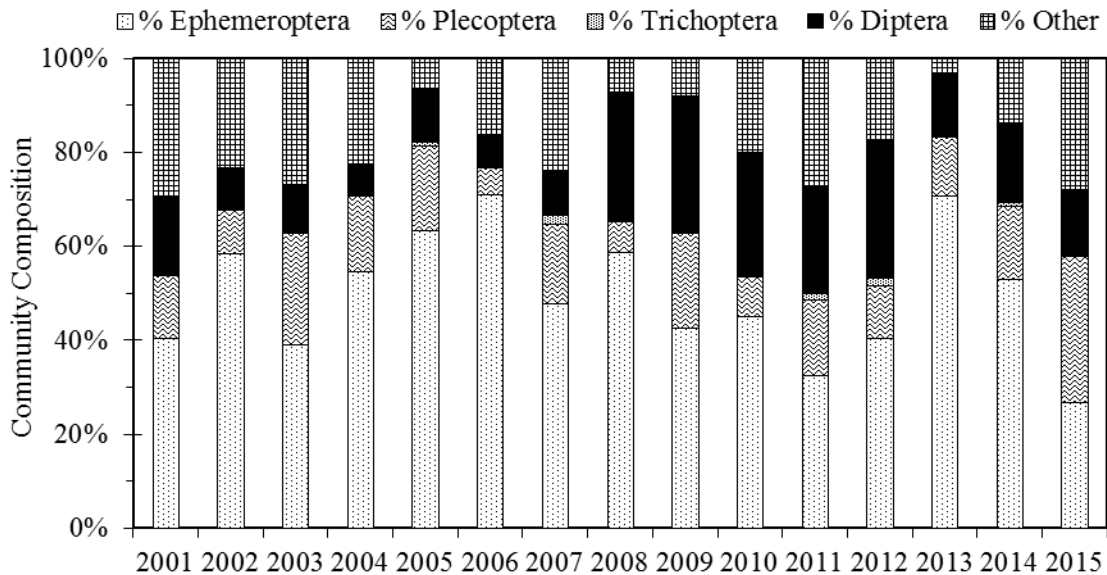

Figure 24.–Tributary Creek Site 9 benthic macroinvertebrate community composition.

ⁿ We collected three additional samples compared to previous years, per the requirements of the updated FWMP (HGCMC 2014, Appendix 1).

Juvenile Fish Populations and Fish Condition

We captured 16 juvenile Dolly Varden char during the 2015 survey (Figure 25), similar to the 2013–2014 survey results. The length frequency diagram of captured fish suggests two age classes were present (Appendix C7), and mean fish condition was 1.20 g/mm³.

We estimate the 2015 juvenile coho salmon population at 95 ± 21 fish, significantly less than the 2014 estimate and within the range observed since 2001 (Figure 25). The length frequency diagram of captured fish suggests two age classes were present, and mean fish condition was 1.37 g/mm³ (Appendix C8).

Figure 25.—Tributary Creek Site 9 juvenile fish population estimates.

Juvenile Fish Metals Concentrations

Ag, Cd, Pb, and Se median concentrations among the 2015 whole body juvenile Dolly Varden char samples^o were greater than previous years, while Cu, Hg and Zn concentrations among the samples were similar to values previously observed (Figure 26).

^o We collected four additional samples compared to previous years, per the requirements of the updated FWMP (HGCMC 2014, Appendix 1).

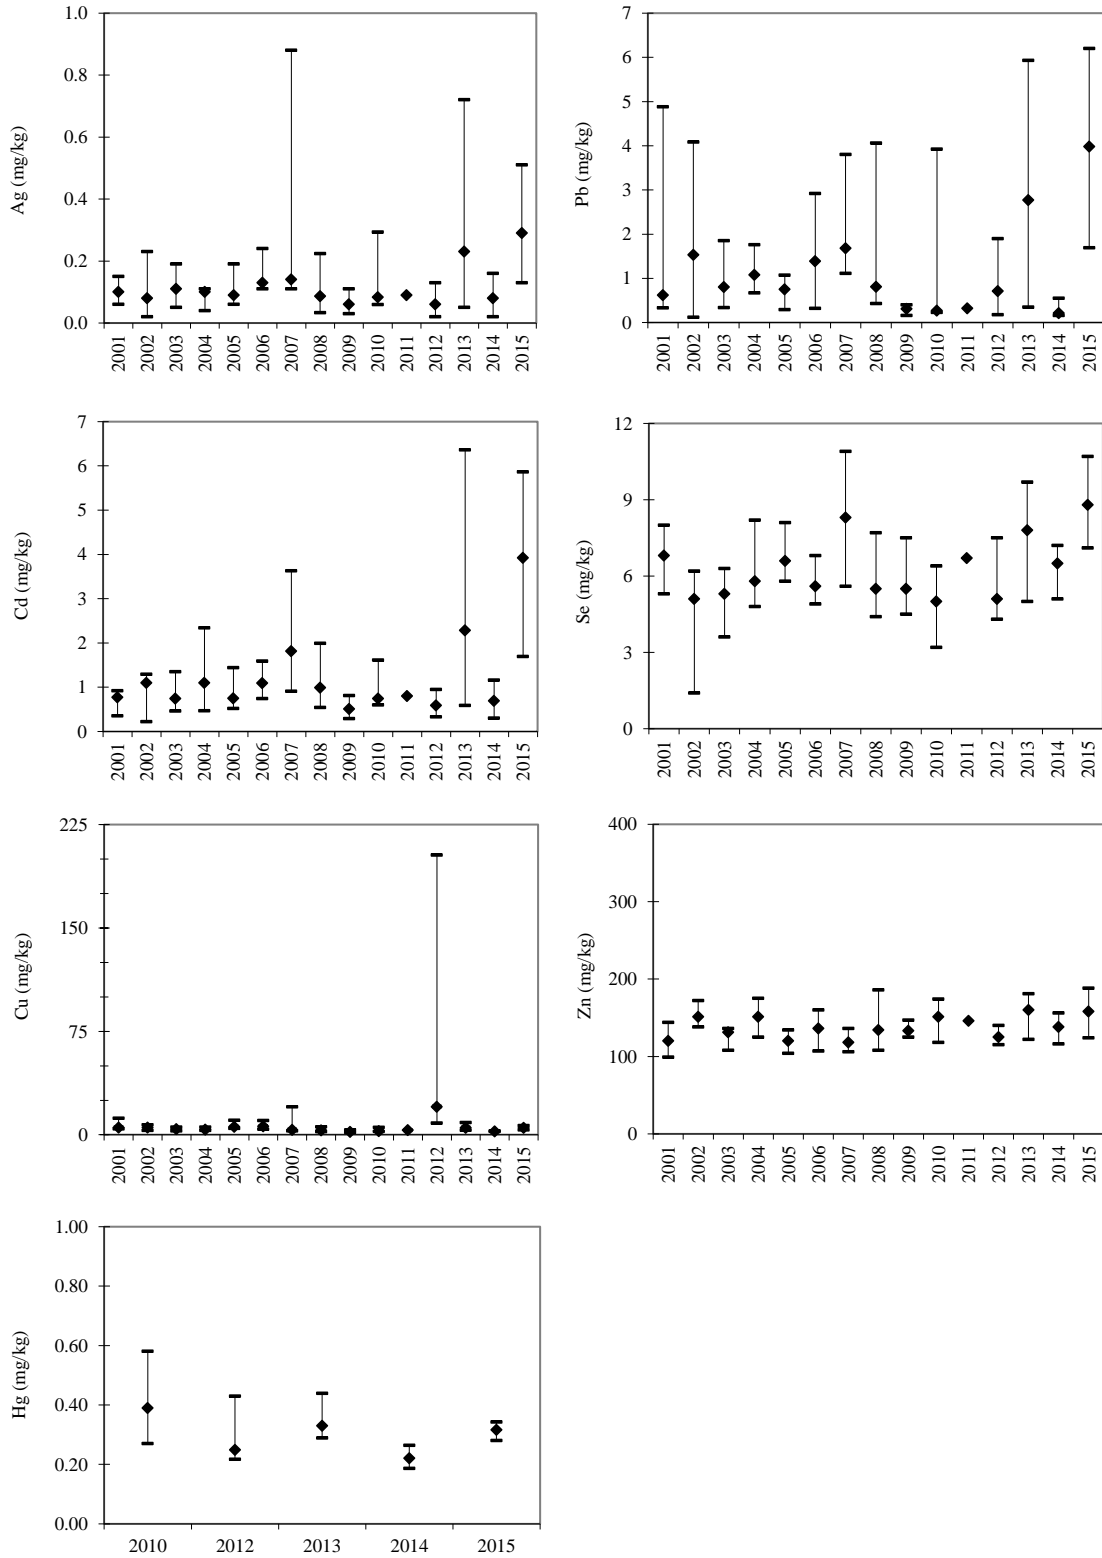

Figure 26.—Tributary Creek Site 9 whole body Dolly Varden char metals concentrations.
Note: Median, minimum, and maximum concentrations (mg/kg) presented.

COMPARISONS AMONG GREENS CREEK SITES

Periphyton Density and Community Composition

Periphyton densities among the 2015 samples from Site 48 and Site 54 were not significantly different. Mean periphyton densities at Site 48 and Site 54 between 2001 and 2014 generally followed a similar trend (Figure 27), with peak densities observed in 2003, 2004, and 2006. Greens Creek discharges prior to sampling in 2003 and 2004 were low and may explain the greater periphyton densities those years, while greater discharges during 2007, 2008, and 2012 may explain the lower periphyton densities observed those years.

Figure 27.—Greens Creek periphyton densities comparison.

Periphyton samples collected at Site 48 and Site 54 have generally contained > 90% chlorophyll *a*, zero or nearly zero chlorophyll *b*, and < 10% chlorophyll *c* each year.

Benthic Macroinvertebrate Density and Community Composition

Benthic macroinvertebrate density (Figure 28) and taxonomic richness (Figure 29) among samples collected at Site 48 and Site 54 generally follow a similar trend between years, and EPT insects usually comprise more than 80% of samples.

Figure 28.—Greens Creek benthic macroinvertebrate densities comparison.

Figure 29.—Greens Creek benthic macroinvertebrate taxa richness comparison.

Juvenile Fish Populations and Fish Condition

The 2015 Site 54 and Site 48 juvenile Dolly Varden char population estimates were not significantly different. Population estimates among sites followed a similar trend from 2001 to 2015 (Figure 30). We captured several age classes of Dolly Varden char at both sites most years, and mean fish condition was similar among sites each year.

Figure 30.—Greens Creek juvenile Dolly Varden char population estimates.
 Note: Site 54 2001–2010 data extrapolated to a 50 m sample reach for comparison.

COMPARISON AMONG SITES

Juvenile Fish Metals Concentrations

Comparing the 2015 Greens Creek juvenile Dolly Varden char whole body metals data, the Site 48 mean ranks for Pb and Se concentrations were significantly less than the Site 54 mean ranks. We observed greater ranges of Cd and Zn concentrations among the Site 54 samples than the Site 48 samples, and a greater range of Cu concentrations among the Site 48 samples.

Comparing the 2015 Greens Creek and Tributary Creek data, the Site 9 mean rank for Zn concentrations was significantly less than the Site 54 and Site 48 mean ranks, and the Site 9 mean ranks for Ag, Cd, Cu,^P Hg, Pb, and Se concentrations were significantly greater than the Site 48 and Site 54 mean ranks. The 2015 median concentrations for all three sites were greater than or similar to median concentrations observed among the samples collected from 2011 to 2013 in Upper Slate Creek (Figure 31) near Kensington Gold Mine (Timothy and Kanouse 2014).

Since 2001, Tributary Creek Site 9 whole body juvenile fish samples had greater concentrations and variability than Greens Creek samples, except Cu and Zn which were generally greater at Site 48 (Figure 32).

^P Though we identified a significant difference among the 2015 Cu data for all sites, the test did not reveal which mean ranks were significantly different.

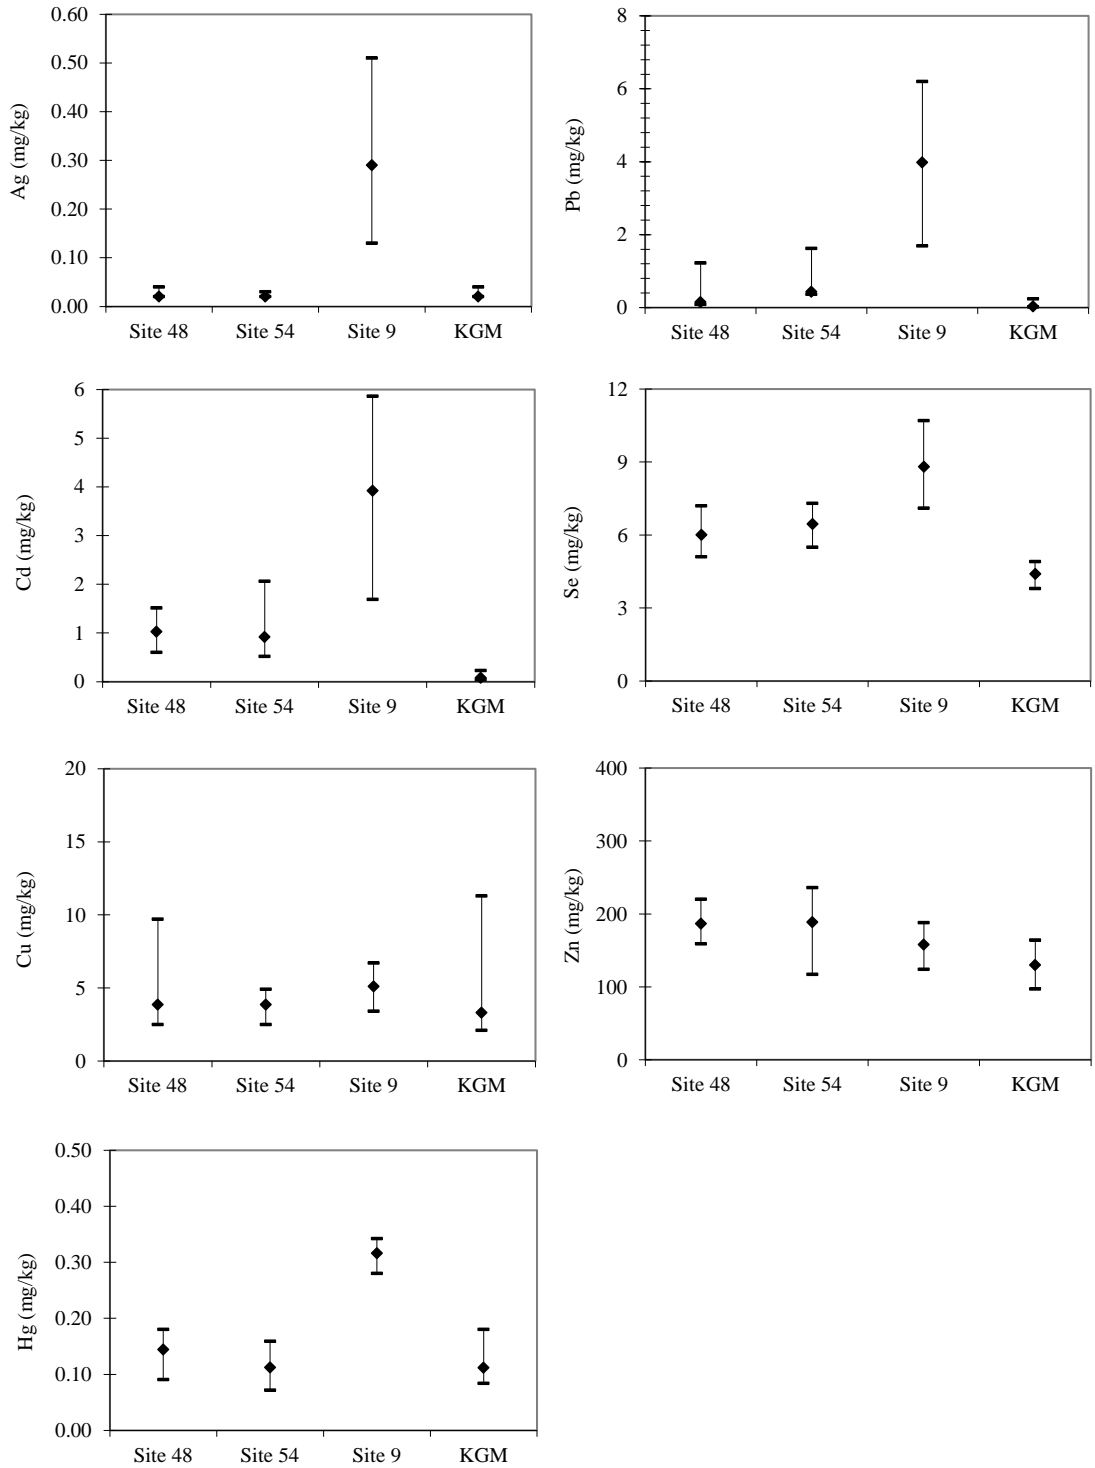

Figure 31.—2015 Greens Creek and Tributary Creek whole body juvenile Dolly Varden char metals concentrations.

Note: Median, minimum, and maximum concentrations (mg/kg) presented. Reference data (KGM) are Upper Slate Creek whole body juvenile Dolly Varden char samples collected 2011–2013 near Kensington Gold Mine (Timothy and Kanouse 2014).

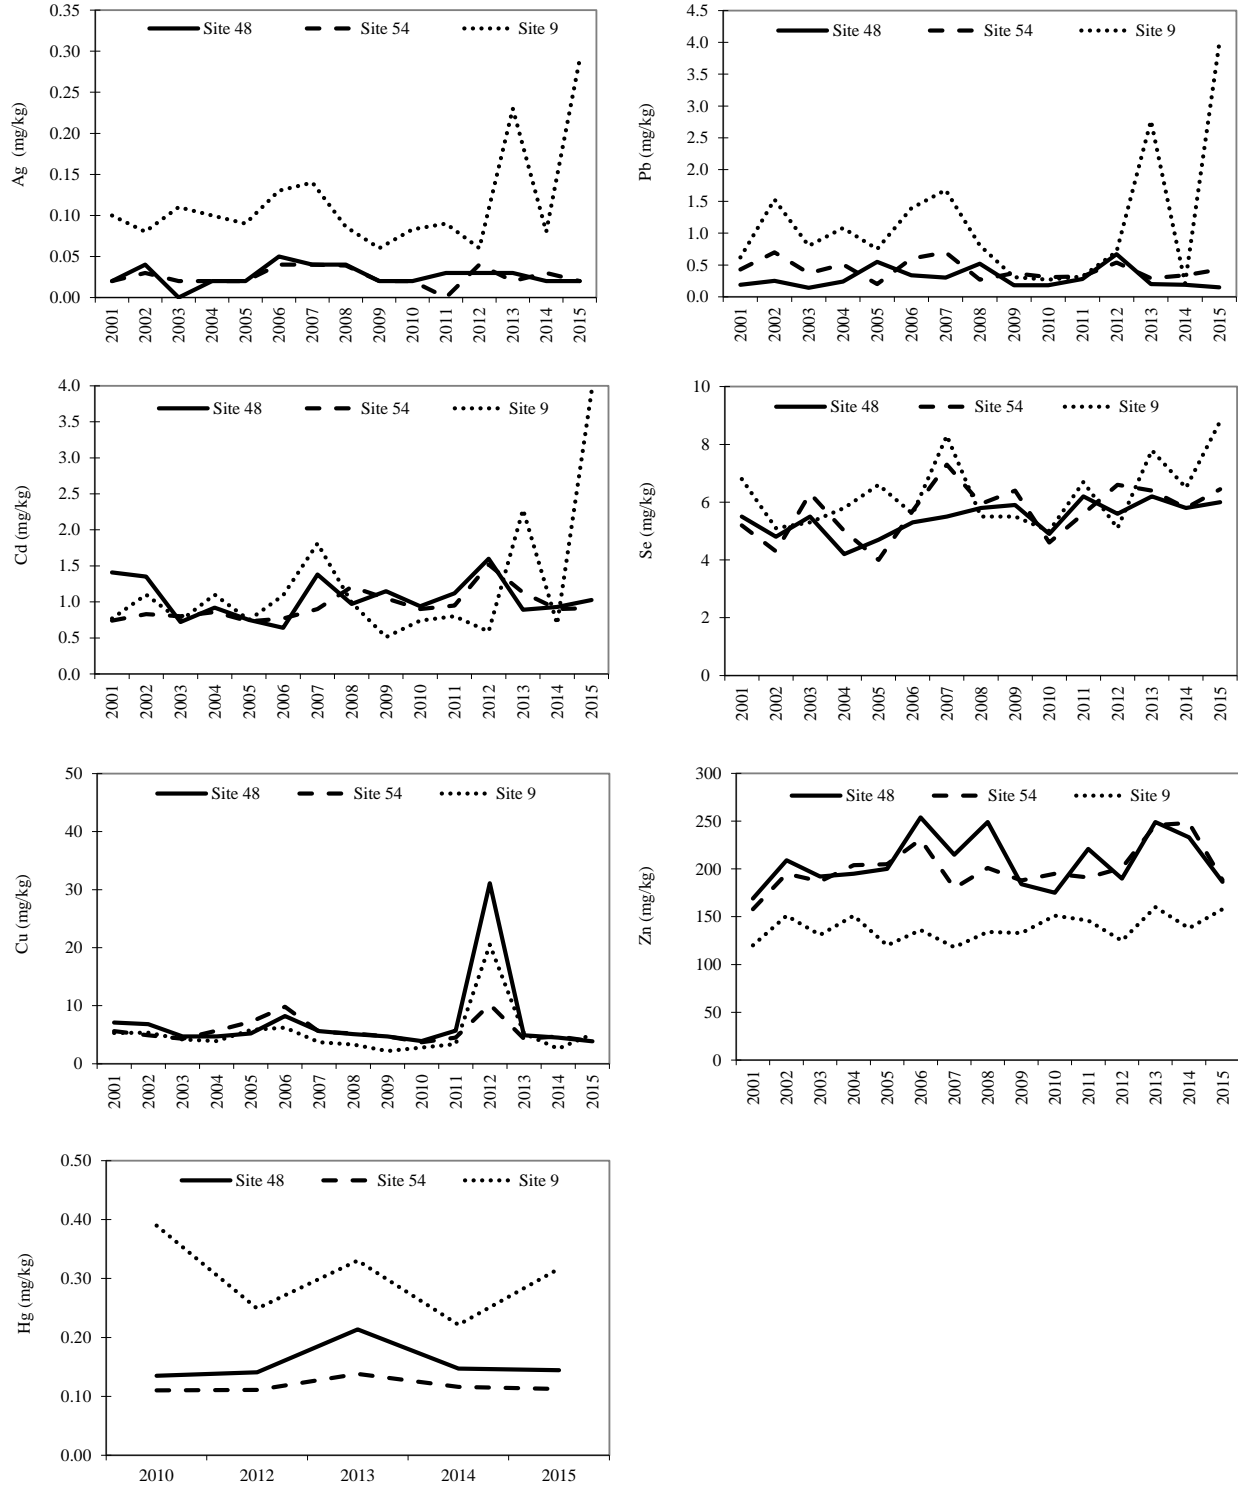

Figure 32.—Greens Creek and Tributary Creek whole body juvenile Dolly Varden char median metals concentrations.

Douglas, AK 99824

RE: Hecla Greens Creek Mine Biomonitoring / Greens Creek Site 48

Dear Kate,

Enclosed are the results of the sample(s) submitted to our laboratory September 30, 2015
For your reference, these analyses have been assigned our service request number **K1510910**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3293. You may also contact me via email at Shar.Samy@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Shar Samy, Ph.D.
Project Manager

Case Narrative

Chain of Custody

Total Solids

Metals

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

ALS ENVIRONMENTAL

Client: Alaska Department of Fish and Game
Project: Hecla Greens Creek Mine Biomonitoring/
Greens Creek Site 48
Sample Matrix: Animal Tissue
Service Request No.: K1510910
Date Received: 09/30/15

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables. When appropriate to the method, method blank results have been reported with each analytical test. Additional quality control analyses reported herein include: Laboratory Duplicate (DUP), Matrix Spike (MS), and Matrix/Duplicate Matrix Spike (MS/DMS).

Sample Receipt

Ten animal tissue samples were received for analysis at ALS Environmental on 09/30/15. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored frozen at -20°C upon receipt at the laboratory.

Total Metals

Matrix Spike Recovery Exceptions:

The control criteria for matrix spike recovery of Zinc for sample Greens Creek Site 48 Sample # 10 were not applicable. The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

No other anomalies associated with the analysis of these samples were observed.

Approved by  _____

Douglas, AK 99824

RE: Hecla Greens Creek Mine Biomonitoring / Greens Creek Site 54

Dear Kate,

Enclosed are the results of the sample(s) submitted to our laboratory September 30, 2015
For your reference, these analyses have been assigned our service request number **K1510913**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3293. You may also contact me via email at Shar.Samy@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Shar Samy, Ph.D.

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

ALS ENVIRONMENTAL

Client: Alaska Department of Fish and Game
Project: Hecla Greens Creek Mine Biomonitoring/
Greens Creek Site 54
Sample Matrix: Animal Tissue
Service Request No.: K1510913
Date Received: 09/30/15

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables. When appropriate to the method, method blank results have been reported with each analytical test. Additional quality control analyses reported herein include: Laboratory Duplicate (DUP), Matrix Spike (MS), and Matrix/Duplicate Matrix Spike (MS/DMS).

Sample Receipt

Ten animal tissue samples were received for analysis at ALS Environmental on 09/30/15. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored frozen at -20°C upon receipt at the laboratory.

Total Metals

Matrix Spike Recovery Exceptions:

The control criteria for matrix spike recovery of Zinc for the Batch QC sample were not applicable. The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

No other anomalies associated with the analysis of these samples were observed.

Approved by  _____

RE: Hecla Greens Creek Mine Biomonitoring / Tributary Creek Site 9

Dear Kate,

Enclosed are the results of the sample(s) submitted to our laboratory September 30, 2015
For your reference, these analyses have been assigned our service request number **K1510914**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3293. You may also contact me via email at Shar.Samy@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

ALS ENVIRONMENTAL

Client: Alaska Department of Fish and Game
Project: Hecla Greens Creek Mine Biomonitoring/
Tributary Creek Site 9
Sample Matrix: Animal Tissue

Service Request No.: K1510914
Date Received: 09/30/15

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables. When appropriate to the method, method blank results have been reported with each analytical test. Additional quality control analyses reported herein include: Laboratory Duplicate (DUP), Matrix Spike (MS), and Matrix/Duplicate Matrix Spike (MS/DMS).

Sample Receipt

Ten animal tissue samples were received for analysis at ALS Environmental on 09/30/15. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored frozen at -20°C upon receipt at the laboratory.

Total Metals

Matrix Spike Recovery Exceptions:

The matrix spike recovery of Copper for the Batch QC sample (BQC1) was outside control criteria. Recovery in the Laboratory The associated QA/QC results (e.g. SRM samples, LCS, method blank, calibration standards, etc.) indicate the analysis was in control. No further corrective action was appropriate.

The matrix spike recovery of Silver for the Batch QC sample (BQC2) was outside control criteria. Recovery in the Laboratory The associated QA/QC results (e.g. LCS, method blank, calibration standards, etc.) indicate the analysis was in control. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.
